

Collaborative Design Session: Architecting the Integrated Family Office OS

Our Vision

We're excited to be building the definitive, enterprise-grade software solution for mid-tier family offices. Our goal is to replace the fragmented ecosystem of spreadsheets and manual processes with a single, elegant platform that provides a true "whole-of-wealth" view.

The Opportunity: The Fragmentation Challenge

Mid-tier family offices manage a complex blend of assets, yet their data is trapped in disconnected silos: listed investments in brokerages like IBKR, private equity fund statements delivered as PDFs, and the financials of their own operating businesses in accounting systems like Xero. Creating a consolidated view of NAV, performance, and exposure is currently a slow, manual, and error-prone process. We see a significant opportunity to solve this with a modern, elegant solution.

Key Puzzles We're Thinking About

As we architect this platform, we're navigating several interesting and difficult challenges. We'd love to get your perspective on them:

- **The Identity Crisis:** How do we create a single, golden record for an asset when it's identified differently across a broker API, a market data feed, and a fund manager's PDF?
- **The Time Paradox:** How can we best present a reliable, consolidated NAV when we have real-time equity prices co-existing with 45-day delayed, quarterly valuations from private equity funds?
- **The Hierarchy Complexity:** The family owns 40% of Operating Company A, which in turn owns 60% of Holding Company B, which holds the IBKR account C. How do we approach look-through calculations for exposure and consolidated reporting?
- **Transactional Edge Cases:** How should a robust architecture handle the innate complexity of multi-step financial events, like a corporate action (e.g., a spin-off) or a capital call that triggers the liquidation of a public security?

Our Goal for this Session

The goal of this session is to explore these challenges together and get your high-level thoughts on a potential architectural and strategic approach. We are most interested in your problem-solving process and how you think about complex systems, trade-offs, and innovative solutions.

We'd love to hear your thoughts on:

1. **Your Architectural Approach:** How might you begin to structure the core database and data pipeline to handle the hurdles listed above in a unified way?
2. **Interesting Trade-offs:** What are the top 2-3 trade-offs you see in any solution (e.g., real-time vs. batch, flexibility vs. performance, data consistency vs. availability)?
3. **Innovative Ideas:** Is there a unique insight or an unconventional approach you would bring to one of these challenges that could be a potential game-changer for our business?

What to Expect

This will be an interactive, collaborative session. We'll use a whiteboard to sketch out ideas and walk through the problem space together. Think of it as a joint design session where we can explore these ideas and learn how you approach building great systems.

Please share your thoughts ahead of the scheduled session in whatever format is most valuable in communicating your solution.
